

Toy trajectory, big:small change ratio 3:1, rep 7 (baseline recall on this rep closest to its 3:1 mean across 20 reps) —
black dashed/solid = true small/big excursion onsets; green/red/grey rug = predicted CPs that hit a small onset / hit a big onset / matched neither — generated by `imbalanced\_change\_toy.py`

fixed $q=0.95$ — $k=2$ clusters, 43 predicted CPs — THIS rep: small recall=0.12, big recall=1.00, precision=0.37

pointwise null, $q=0.5$ — $k=2$ clusters, 412 predicted CPs — THIS rep: small recall=1.00, big recall=0.62, precision=0.06
